- A logarithmic function is the inverse of an exponential function:
If $\log _{b} x=c$ then $b^{c}=x$ and $\log _{b} b^{x}=x$.
- Special case where the base $b$ of the exponential is $e$.
- We call it the natural logarithm (natural $\log$ ) and it has its own notation: $\log _{e} x=\ln x$.

## Session 3 <br> (Logarithms) <br> Logarithms: review

Boris Babic
INSEAD

Logarithmic
functions
Exponential
and
Logarithmic
Equations
Case: pricing Derivatives

Natural log is the inverse of the exponential function of base $e$ : $e^{x}=c \leftrightarrow \ln c=x$ or $\ln e^{x}=x$.

## Session 3 <br> Logarithmic applications

Boris Babic,
INSEAD

Logarithmic functions

Exponential and
Logarithmic Equations

Case: pricing
Derivatives

- Logarithms are often used for measurement scales, where we need to compare orders of magnitude.
- Magnitude 6 earthquake is 10 times stronger than magnitude 5 earthquake. Magnitude 7 earthquake is $10 \times 10=100$ times strong than magnitude 5 earthquake.

Order in which websites are presented to you when you search on Google

Richter scale for earthquakes

Decibels for sound

Logarithms are also present in many "laws" in economics, statistics, finance, psychology, etc.

Economics: economies of scale

Psychology: how human beings make decisions (Hick's law)

$$
T=b \log _{2}(n+1)
$$

$T$ : time to react
$n$ : number of choices

- How to solve equations that involve exponentials and logarithms?
- Formulas at our disposal:

$$
\begin{aligned}
& e^{x}=e^{y} \leftrightarrow x=y \\
& \ln x=\ln y \leftrightarrow x=y \\
& e^{\ln x}=x \\
& \ln \left(e^{y}\right)=y
\end{aligned}
$$

## 

Boris Babic,
INSEAD

Logarithmic

## functions

Exponential and
Logarithmic Equations

Case: pricing
Solve for $x$ :
(1) $e^{x}=p$
(2) $e^{3 x}=403.43$
(3) $\ln (x+1)=2$
(4) $\ln (3 x-2)=5$

- more challenging -
(5) $\ln (x)+\ln (x+6)=\ln (5 x+12)$
(6) $\ln (10)-\ln (7-x)=\ln (x)$

## 

Boris Babic,
INSEAD

Logarithmic

## functions

Exponential
and
Logarithmic Equations

Solve for $x$ :

- $e^{x}=p \rightarrow x=\ln p$
- $e^{3 x}=403.43 \rightarrow x=2$
- $\ln (x+1)=2 \rightarrow x=e^{2}-1$
- $\ln (3 x-2)=5 \rightarrow x=\frac{1}{3}\left(e^{5}+2\right) \approx 50.138$

##

INSEAD

Logarithmic
functions
Exponential and
Logarithmic Equations

Case: pricing
Derivatives

$$
\begin{aligned}
\ln (10)-\ln (7-x) & =\ln (x) \\
\ln \left(\frac{10}{7-x}\right) & =\ln x \\
\left(\frac{10}{7-x}\right) & =x \\
10 & =x(7-x) \\
10 & =7 x-x^{2} \\
x^{2}-7 x+10 & =0 \\
(x-5)(x-2) & =0 \\
\rightarrow x=2, x=5 &
\end{aligned}
$$

## Summary of logs and exponents

Logarithmic

## functions

Exponential
and
Logarithmic Equations

Case: pricing
Derivatives

- Exponential function is a function of the type $f(x)=b^{x}$
- Logarithmic function is the inverse of this function, $\log _{b}\left(b^{x}\right)=x$
- Applications: for exponents, compounded growth (GDP, population growth, interest); for logarithms, order of magnitude scales, statistics, utility functions.
- Solving exponential and logarithmic equations.
- Special case of $b=e \approx$ 2.71828: $f(x)=e^{x}$, and $f(x)=\ln x$.

## Rate of change of linear functions

Boris Babic,
INSEAD
Example of linear function: $f(x)=2 x-1$
Logarithmic functions

Exponential and

## Logarithmic

 EquationsCase: pricing
Derivatives

- Rate of change: $\frac{\text { change in } f(x)}{\text { change in } x}$
- If $x$ changes from 0 to 5 what values does $f(x)$ take?
- What is the rate of change here?
- Does it depend on the points we pick? What does it correspond to?

- The steeper the curve, the larger the rate of change
- Slope $=0$, horizontal line. Slope $=\infty$, vertical line.

## Rate of change of nonlinear functions

- Like linear functions, would like to find the slope of the curve.
- But the "slope" of the curve is changing along the curve.
- Thus, rate of change will be point specific (point??).
- Given by the slope of the tangent line at that "point."

## Rate of change of nonlinear functions

Boris Babic,
INSEAD

Logarithmic functions

Exponential
and
Logarithmic Equations

Case: pricing

- The slope of the tangent can be viewed as the slope of a (shrinking) chord (green) - secant line.

$$
\frac{y_{2}-y_{1}}{x_{2}-x_{1}}=\frac{\Delta y}{\Delta x}
$$

- This gives us average rate of change over a (small) interval.
- Ex: average speed (per minute).

## Derivatives

Logarithmic

## functions

Exponential and
Logarithmic Equations

Case: pricing
Derivatives

- What if we want instantaneous speed (huh?)
- Find the value as the chord shrinks to 0 .
- That is, as $\Delta x \rightarrow 0$ and $\Delta y \rightarrow 0$.
- Derivative of $f$ at $x$ :

$$
f^{\prime}(x)=\frac{d}{d x} f(x)=\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)}{h}
$$

where $h=\Delta x$ and $[f(x+h)-f(x)]=\Delta y$.

- Ex: use this definition to find $\frac{d}{d x} x^{2}$.
- Ex: use it to find $\frac{d}{d x} \log x$. Hint: $\lim _{k \rightarrow 0} \frac{\log (1+k)}{k}=1$.

## Logarithmic

functions
Exponential
and
Logarithmic
Equations
Case: pricing
Derivatives

$$
\begin{aligned}
f^{\prime}(x) & =\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)}{h} \\
& =\lim _{h \rightarrow 0} \frac{(x+h)^{2}-x^{2}}{h} \\
& =\lim _{h \rightarrow 0} \frac{x^{2}+2 h x+h^{2}-x^{2}}{h} \\
& =\lim _{h \rightarrow 0} \frac{2 h x+h^{2}}{h} \\
& =\lim _{h \rightarrow 0} \frac{h(2 x+h)}{h} \\
& =\lim _{h \rightarrow 0} 2 x+h \\
& =2 x
\end{aligned}
$$

$$
\begin{aligned}
f^{\prime}(x) & =\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)}{h} \\
& =\lim _{h \rightarrow 0} \frac{\log (x+h)-\log (x)}{h} \\
& =\lim _{h \rightarrow 0} \frac{\log \left(\frac{x+h}{x}\right)}{h} \\
& =\lim _{h \rightarrow 0} \frac{\log \left(1+\frac{h}{x}\right)}{h} \\
& =\lim _{h \rightarrow 0} \frac{\log \left(1+\frac{h}{x}\right)}{\frac{h}{x}} \cdot \frac{1}{x} \\
& =1 \cdot \frac{1}{x}=\frac{1}{x}
\end{aligned}
$$

Session 3 (Logarithms)

Logarithmic functions

Exponential and
Logarithmic Equations

Case: pricing Derivatives

## Rules for differentiation

- $f(x)=a \rightarrow f^{\prime}(x)=0$, and $f(x)=x \rightarrow f^{\prime}(x)=1$
- $f(x)=b x \rightarrow f^{\prime}(x)=b$
- $f(x)=x^{n} \rightarrow f^{\prime}(x)=n x^{n-1}$
- $f(x)=b x^{n} \rightarrow f^{\prime}(x)=b n x^{n-1}$
- $f(x)=x \rightarrow f^{\prime}(x)=1$
- $(f(x)+g(x))^{\prime}=f^{\prime}(x)+g^{\prime}(x)$
- $[f(x) g(x)]^{\prime}=f^{\prime}(x) g(x)+f(x) g^{\prime}(x)$
- $f(g(x))=f^{\prime}(g(x)) g^{\prime}(x)$
- $[\log (x)]^{\prime}=1 / x$, and $\left(e^{x}\right)^{\prime}=e^{x}$

## 

Boris Babic,
INSEAD

Logarithmic

## functions

Exponential
and
Logarithmic
Differentiate the following functions:

- $f(x)=7 x+5$

Derivatives

- $f(x)=x^{2}+3 x+4$
- $f(x)=5 x^{7}+3 x^{4}+x^{2}+4 x+100$
- $f(x)=e^{3 x^{2}}$

## Session 3 <br> (Logarithms) <br> Practice Solutions

Differentiate the following functions:

- $f(x)=7 x+5 \rightarrow f^{\prime}(x)=7$
- $f(x)=x^{2}+3 x+4 \rightarrow f^{\prime}(x)=2 x+3$
- $f(x)=5 x^{7}+3 x^{4}+x^{2}+4 x+100 \rightarrow f^{\prime}(x)=$ $35 x^{6}+12 x^{3}+2 x+4$
- $f(x)=e^{3 x^{2}}$

$$
\begin{aligned}
& f(x)=e^{x}, g(x)=3 x^{2} \rightarrow f^{\prime}(g(x)) g^{\prime}(x)=e^{3 x^{2}} \cdot 6 x= \\
& 6 x e^{3 x^{2}}
\end{aligned}
$$

- We are given some function $f(x)$ and want to know something about its behavior at $x_{1}$.
- Find $f^{\prime}(x)$.
- Find $f^{\prime}\left(x_{1}\right)$.
- If $f^{\prime}\left(x_{1}\right)>0$ the function is increasing "at that point".
- $f^{\prime}\left(x_{1}\right)<0$ the function is decreasing "at that point".
- if for all $x, f^{\prime}(x)>0$ the function is increasing.
- if for all $x, f^{\prime}(x)<0$ the function is decreasing.
- $f^{\prime}\left(x_{1}\right)=0$ the function is at a maximum or minimum (most likely).

Boris Babic,
INSEAD

Logarithmic

## functions

Exponential
and
Logarithmic Equations

Case: pricing
Derivatives

Consider the function $f(x)=2 x^{3}+x^{2}-4 x-3$

- Find $f^{\prime}(x)$.
- Evaluate $x$ at $(-2,-1,0,1,1.5)$.

## Session 3 <br> (Logarithms) <br> Solution

## Boris Babic

INSEAD

## Logarithmic

## functions

## Exponential

and
Logarithmic

- $f^{\prime}(x)=6 x^{2}+2 x-4$
- $f^{\prime}(-2)=16$
- $f^{\prime}(-1)=0$
- $f^{\prime}(0)=-4$
- $f^{\prime}(1)=4$
- $f^{\prime}(1.5)=12.5$
